

Heart Anatomy Diagram

The heart is a fist-sized, muscular organ that pumps blood through the body. Every day, the heart pumps about 2,000 gallons (7,600 liters) of blood, beating about 100,000 times.

Directions: Label the chambers, valves, and blood vessels in the heart. Color the parts of the heart and the blood vessels that are oxygen rich with one color and oxygen poor with another color. Draw in the electrical pathway through the heart and label the parts.
